

WHAT IS CLAIMED IS:

1. An electron-emitting device comprising:

(A) fiber comprising carbon as a main ingredient,
and

5 (B) a layer made of oxide composed of a material
selected from Ti, Zr, Nb, and Al or a layer made of
oxide semiconductor composed of a material selected
from Ti, Zr, and Nb,

wherein the fiber comprising carbon as a main
10 ingredient is disposed on the layer and the fiber
comprising carbon as a main ingredient partially
contains Pd.

2. The electron-emitting device according to
15 claim 1, wherein the Pd is disposed at a position where
the fiber comprising carbon as a main ingredient is in
contact with the layer.

3. The electron-emitting device according to
20 claim 1, wherein the Pd is disposed on an end of the
fiber comprising carbon as a main ingredient or on an
intermediate point of the fiber comprising carbon as a
main ingredient.

25 4. The electron-emitting device according to
claim 1, wherein the fiber comprising carbon as a main
ingredient is grown via Pd particles disposed on the

layer.

5. The electron-emitting device according to
claim 1, wherein the fiber comprising carbon as a main
5 ingredient includes a graphen.

6. The electron-emitting device according to
claim 1, wherein the fiber comprising carbon as a main
ingredient includes a plurality of layered graphens.

10

7. The electron-emitting device according to
claim 6, wherein the plurality of graphens is layered
in an axial direction of the fiber comprising carbon as
a main ingredient.

15

8. The electron-emitting device according to
claim 1, wherein the fiber comprising carbon as a main
ingredient is made of graphite nanofiber, carbon
nanotube, amorphous carbon, or a mixture containing
20 more than one of these.

9. The electron-emitting device according to
claim 1, further comprising:

a first electrode on a surface of a substrate, and
25 a second electrode disposed on the surface of the
substrate and spaced apart from the first electrode,
means for applying a potential higher than the

first electrode to the second electrode,

wherein at least a part of the layer is disposed
on the first electrode.

5 10. The electron-emitting device according to
claim 9, wherein the first electrode is larger in
thickness than the second electrode.

10 11. The electron-emitting device according to
claim 9, wherein the fiber comprising carbon as a main
ingredient is disposed farther than the second
electrode from the surface of the substrate.

15 12. The electron-emitting device according to
claim 9, wherein the surface of the substrate has a
step height such that the first electrode is higher
than the second electrode.

20 13. An electron source comprising a plurality of
electron-emitting devices,

wherein the electron-emitting device is an
electron-emitting device according to any one of claims
1 to 12,

25 14. An image-forming apparatus comprising:
an electron source according to claim 13, and
an anode where an electron emitted from the

electron source comes into collision.

15. The image-forming apparatus according to claim 14, wherein the anode has a phosphor.

5

16. An electron-emitting device comprising:

(A) first and second electrodes disposed with a gap on a surface of a substrate,

(B) a plurality of fibers each comprising carbon
10 as a main ingredient electrically connected with the first electrode, and

(C) means for applying a voltage higher than the first electrode to the second electrode,

wherein ends of the plurality of fibers each
15 comprising carbon as a main ingredient are higher than a surface of the second electrode from the surface of the substrate, and

a layer made of oxide composed of a material selected from Ti, Zr, Nb, and Al or a layer made of
20 oxide semiconductor composed of a material selected from Ti, Zr, and Nb is disposed between the first electrode and the plurality of fibers each comprising carbon as a main ingredient.

25 17. The electron-emitting device according to claim 16, wherein the layer and the plurality of fibers each comprising carbon as a main ingredient are

connected to each other via a catalyst material.

18. The electron-emitting device according to
claim 17, wherein the catalyst material is a material
5 selected from Pd, Ni, Fe, Co, and an alloy of these.

19. The electron-emitting device according to
claim 16, wherein the first electrode is larger in
thickness than the second electrode.

10

20. An electron source comprising a plurality of
arranged electron-emitting devices,

wherein the electron-emitting device is an
electron-emitting device according to any one of claims
15 16 to 19.

21. An image-forming apparatus comprising:
an electron source and
an image-forming member
20 wherein the electron source is an electron source
according to claim 20.

22. An electron-emitting device comprising:
(A) fiber comprising carbon as a main ingredient,
25 (B) a layer made of oxide composed of a material
selected from Ti, Zr, Nb, and Al or a layer made of
oxide semiconductor composed of a material selected

from Ti, Zr, and Nb,

wherein the fiber comprising carbon as a main ingredient is disposed on the layer, and

the fiber comprising carbon as a main ingredient
5 includes a plurality of layered graphens.

23. The electron-emitting device according to claim 22, wherein the plurality of graphens are layered in an axial direction of the fiber comprising carbon as
10 a main ingredient.

24. The electron-emitting device according to claim 22, wherein the fiber comprising carbon as a main ingredient is grown via Pd particles disposed on the
15 layer.

25. The electron-emitting device according to claim 22, wherein the fiber comprising carbon as a main ingredient contains Pd.
20

26. An electron source comprising a plurality of electron-emitting devices,
wherein the electron-emitting device is an electron-emitting device according to any one of claims
25 22 to 25.

27. A method for manufacturing an image-forming

apparatus,

the apparatus comprising an electron source and an image-forming member,

wherein the electron source is an electron source
5 according to claim 26.

28. A method for manufacturing an electron-emitting device, which includes fiber comprising carbon as a main ingredient, comprising the steps of:

10 (A) providing a layer made of oxide composed of a material selected from Ti, Zr, Nb, and Al or a layer made of oxide semiconductor composed of a material selected from Ti, Zr, and Nb,

(B) disposing catalyst particles on the layer, and

15 (C) heating the substrate on which the catalyst particles are disposed in an atmosphere containing carbon compound.

29. The method for manufacturing the electron-emitting device according to claim 28, wherein the
20 carbon compound is hydrocarbon gas.

30. The method for manufacturing the electron-emitting device according to claim 28, wherein the
25 layer is formed on the electrode disposed on the substrate.

31. The method for manufacturing the electron-emitting device according to claim 28, wherein the layer is formed by the step of forming a conductive layer made of a material selected from Ti, Zr, Nb, and Al on the substrate and oxidizing a surface of the conductive layer.

32. The method for manufacturing the electron-emitting device according to claim 31, wherein the step of oxidizing the surface of the conductive layer is carried out by the step of forming a material of the catalyst particles on the surface of the conductive layer and oxidizing the material.

33. The method for manufacturing the electron-emitting device according to claim 28, wherein the catalyst particles are made of a material selected from Pd, Ni, Fe, Co, and an alloy of these.

34. A method for manufacturing an electron-emitting device, which includes a plurality of electron-emitting devices,

wherein the electron-emitting device is manufactured by the manufacturing method according to any one of claims 28 to 33.

35. A method for manufacturing an image-forming

apparatus, which includes an electron source and an image-forming member,

wherein the electron source is manufactured by the manufacturing method according to claim 34.
